Buttons.....	5

# 1

## Prepare

---

Before you start. Please ensure that you have at least one computer with a spare USB 2.0 port. Below is a list of software and requirements you should also prepare:

At least one application that enables you to speak over the internet for free.

# 2

## Connections

---

Unpack the USB VoIP Dialpad, connect the USB cable to your computer and to the rear of the USB VoIP Dialpad. Now power on your computer. With Windows 2000 and Windows XP, the Drivers will automatically be located and installed. The keypad will light up once the Dialpad is configured correctly.

2 sets of switchable connectors have been provided, one for the supplied headset, the other for desktop speakers and mic; both are interchangeable. Speaker connector is green, Mic connector is pink. The Audio A-B switch simply switches audio in and out to A or B connector, great for switching between private conversation or conference.

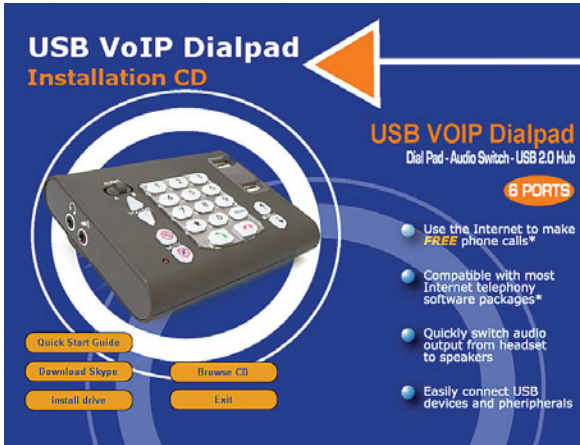

USB 2.0 High Speed ports have been provided so you can plug in all your peripherals. No need to purchase an additional USB hub!

# 3

## Software

To use the numbers on the dialpad to make phone calls or control applications such as Skype™, you will need to install additional software from the provided CDROM.

Insert the CDROM and you should see the following Autorun appear.

If you haven't already got it installed, download and install your favorite voice enabled internet chat application. We have provided a link to install Skype, though this isn't the only application that the USB VoIP Dialpad works with.

If you are planning on using Skype and in particular Skypeout™, then you will also need to install the included middleware application. This will enable the full keypad as well as the Skype specific keys.

Click on the button marked "Install Skype Driver". Follow the instructions and the driver will finish installing.

# 4

# Skype®

After the Skype driver is installed, or during the process you may see a message like this:

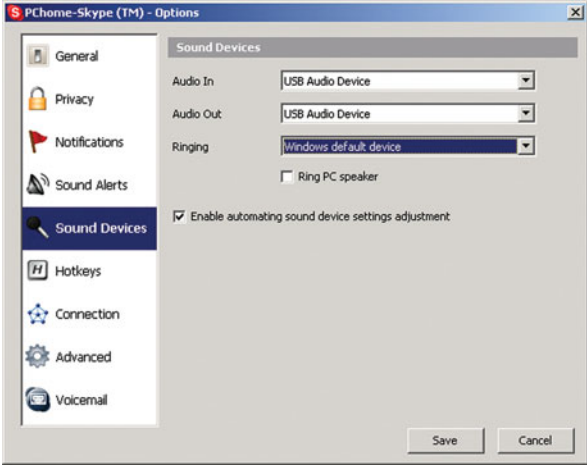

For the Dialpad to work correctly with Skype, you must allow the Middleware Driver to control Skype automatically. Click on the top option marked

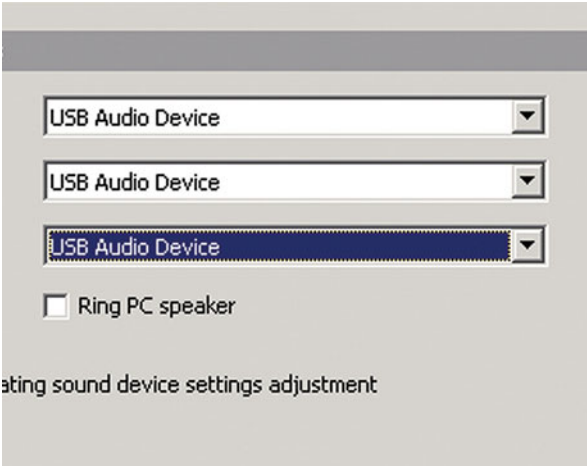

**Allow this program to use Skype**

Once this is done, the special features implemented in the Dialpad will be enabled.

If you have other audio devices, you may want to perform additional configuration steps. For example you may want to use existing speakers and only use 1 audio connection on the Dialpad. To do this open the Skype configuration screen, select Sound Devices.

The default is for the Dialpad to take over all audio functions for your computer. If you wish to choose different devices for calls to ring or for MIC input, you can change them here.

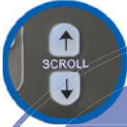

\* If you want to use the MUTE feature on the Dialpad, the Generic USB Audio device must be set as the Windows Default sound device.

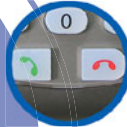

# 5

## Buttons

Scroll buttons scroll through your contact list in Skype. The Contacts screen must be in the foreground to use these keys.

Menu button has 2 functions: first, it will always bring Skype to the front of all your windows. Second, it will cycle through your Skype screens from left to right.

Buttons to Answer and Hangup Skype calls without using the computer keyboard.

Mute buttons for MIC mute and SPEAKER mute. The SPEAKER mute will only mute the dialpad if it is the default audio device in your operating system.

### USB VoIP Dialpad

Lastly, the A-B audio selector. Select A to route audio to the left, B to the right.

Volume control for adjusting output volume.

## Included in this box are:

- USB VoIP Dialpad
- Power Adapter
- 6ft USB 2.0 Cable
- Installation CD containing drivers enabling the dialpad for use with Skype, Quick Start guide and Manual in PDF form
